(54) Title: VACCINES

(57) Abstract

Solid vaccine compositions comprise an antigenic substance, a saponin and a polycationic adjuvant such as DEAE-dextran. The antigenic substance gives rise to antibodies either for the purpose of fighting infections or for other purposes: for example, antibodies against GnRH can modulate fertility. The combination of a saponin and a polycationic adjuvant gives the vaccine improved longevity and enables it to be used as an implant.

1

VACCINES 1 2 This invention relates to vaccines. 3 4 Vaccines have classically been used in the prevention 5 An antigen having antigenic of disease. 6 characteristics of a disease-causing entity (such as a 7 microbe or toxin) is parenterally administered to man 8 or another animal, and the animal's immune system is 9 stimulated to produce antibodies which will react both 10 with the antigen administered and the disease-causing 11 agent itself. 12 13 More recently, vaccines have also been used for other 14 purposes, particularly in the modulation of hormonal 15 Antibodies generated against a hormone 16 antigen may cross react with endogenous hormone in the 17 A primary (but not exclusive) animal's body. 18 application of this new vaccine technology is the 19 production of vaccines for fertility control. 20 21 The antigenicity of many potential antigens is 22 frequently enhanced by the co-application of antigens 23 with immunoadjuvants, which may be regarded as 24 substances which, while not necessarily being antigenic 25 themselves, potentiate or enhance an animal's immune 26 response to the challenging antigen. 27 28 A wide range of adjuvants is known. Examples include 29 Freund's complete and incomplete adjuvants (FCA and 30 saponins, aluminium compounds, including 31 aluminium phosphate and aluminium hydroxide 32 (particularly in the form known as alhydrogel), 33

2

polycationic electrolytes, polyanionic electrolytes, muramyl dipeptide and Adjuvant 65, which contains highly refined peanut oil and chemically pure mannide monooleate and aluminium monostearate as emulsifier and stabiliser respectively.

6

Fiven with the availability of the above and many other adjuvants, it is sometimes difficult to formulate vaccines for inducing antibodies against particular antigens. Gonadotrophin releasing hormone (GnRH, otherwise known as luteinising hormone releasing hormone (LHRH) is a case in point.

13

14 It is commercially desirable to formulate a GnRH 15 vaccine for veterinary use, particularly but not 16 exclusively for domestic livestock. An antigen GnRH preparation is useful as a fertility regulating or an 17 immunological neutering vaccine in male (for 18 immunocastration) and female (for immunospaying) 19 It is indicative of the difficulties of 20 animals. formulating a GnRH vaccine that the neutering 21 properties of GnRH have been known since 1972, but it 22 23 is only now that vaccines based on GnRH are beginning 24 to emerge commercially [Hoskinson et al, Aust. 25 Biotech, 4, 166-170(1990)]. The utility of a GnRH 26 vaccine is demonstrated by the experiences of 27 Australian stock farmers. In extensively grazed cattle raised for beef, up to 80% of the cull cows can 28 become pregnant, thereby causing the farmer 29 considerable economic loss at slaughter because the 30 31 carcase value is downgraded.

32

3

GnRH can be formulated as a vaccine with Freund's 1 complete adjuvant (FCA), which comprises a suspension 2 of heat-killed M. tuberculosis mycobacteria in mineral 3 oil containing a surfactant. Although FCA is recognised as a powerful adjuvant, it has not found 5 wide application outside the laboratory because of the 6 7 adverse tissue reaction it provokes in recipient In fact, FCA is banned from veterinary use. 8

9 10

11

12 13

14

15

16

A different approach to the problem is disclosed in WO-A-8706129, which suggests the use of an implant containing microencapsulated immunogens of GnRH (or another antigen) within a biodegradable polymer. The level of development of this technology as a practical matter, is still unclear; however, no commercial product based on the technology appears yet to have been launched.

17 18

33

The only GnRH vaccine on the market is a two-shot 19 mineral oil based emulsion vaccine in accordance with 20 the teaching of WO-A-8801177 [Hoskinson et al, Aust J. 21 Biotech, 4 166-170 (1990)]. Although excellent results 22 can be obtained by the use of such a vaccine, it would 23 be desirable to eliminate the necessity of having oil 24 present, and it would also be desirable to improve the 25 longevity of action of the vaccine so that two shots 26 were not required. The problem with having the mineral 27 oil present, is that it can cause localised irritation 28 at the site of injection or implantation, leading among 29 other undesirable effects, to the formation of sterile 30 abscesses and granulomas; further, it is generally 31 desirable to avoid the use of petrochemical-derived 32

4

1 materials in preparations administered to animals,
2 particularly parenterally.

3

The problem with a two-shot vaccine is more of a 4 practical one for the farmer. The farmer will want to 5 muster his livestock once a year in order to tag the 6 herd and also for other veterinary purposes. 7 8 vaccine can therefore be conveniently administered at the mustering. However, if a second muster is needed 9 10 several weeks later for a second, booster vaccination, this represents a considerable expenditure of effort 11 12 purely for vaccination purposes, as there is otherwise no need for the second muster. In pastoral regions 13 where ovine footrot is a problem, there is a need for 14 two or more booster vaccinations to maintain high 15 16 antibody levels in the sheep during the critical 17 season. Longevity of action is therefore a desirable goal for a vaccine in order to avoid the unnecessary 18 19 handling of animals.

20

33

21 It can be seen that there is a need for a vaccine which 22 at least partially solves one or both of the two 23 problems discussed above. Furthermore, it would be 24 preferred if the action of the vaccine was reversible, 25 particularly for a fertility-regulating vaccine such as 26 one based on GnRH, so as to widen the potential market 27 for the vaccine, for example to include horses. 28 Further, it would be preferred if an effective vaccine 29 could be formulated in solid form, which resulted in minimal tissue reaction at the implantation site and 30 31 which conferred user safety by minimising the 32 possibility of a farmer injecting himself with the

5

formulation and was able to provide improved shelf life stability.

3

According to a first aspect of the present invention, there is provided a solid vaccine composition comprising an antigenic substance capable of inducing the generation of antibodies on parenteral administration to an animal, a saponin and a

9 polycationic adjuvant.

10

11 Although saponin and polycationic compounds have 12 individually been used as adjuvants in the past, as 13 have many other adjuvants, the art does not seem to 14 have realised that this particular combination of 15 adjuvants, when formulated as a solid, has particularly 16 beneficial properties when used in a vaccine in 17 accordance with this invention.

18

In the art, Solyom (Dev. Biol. Stand 34 169-178 (1977)) 19 has separately evaluated DEAE-dextran (a polycationic 20 adjuvant) and saponin in foot and mouth disease 21 Mitev et al (Vet. Med. Nauki. 12 16-22 22 vaccines. (1975)) teaches that vaccines containing DEAE-dextran 23 are generally inferior to oil-based vaccines; it is 24 also suggested that saponin is a better sole adjuvant 25 that DEAE-dextran. Gorskii (Uchenye Zap. Kazans. Vet. 26 <u>Inst.</u> 122 48-49 (1976)) takes the opposite view to 27 Mitev et al and teaches that DEAE-dextran is a superior 28 adjuvant to saponin for foot and mouth disease virus. 29 The efficacy of saponin, DEAE-dextran and aluminium 30 hydroxide in a foot and mouth disease vaccine have also 31 been evaluated in pig trials; here, DEAE-dextran 32 performed better than Al(OH)3 or saponin (Sellers and 33

6

Herniman Brit. Vet. J. 30 440-445 (1974)). The short 1 2 lived nature of the immune response elicited to foot 3 and mouth disease by DEAE-dextran or saponin has been 4 described by Anderson et al (Res. in Vet. Sci. 12 5 351-357 (1971)). In contrast, this group demonstrate 6 that oil-based emulsion adjuvants have longevity. 7 superior efficacy of Freund's adjuvant to others such 8 as DEAE-dextran is described by Beh and Lascelles 9 (Immunology 54 487-495 (1985)). Indeed, these authors 10 state that no interactions between the different classes of adjuvant examined is observed. WO-A-8801177 11 teaches synergy between an oil adjuvant and a 12 13 polycationic adjuvant; although this formulation is efficacious with GnRH and exhibits longevity, it relies 14 on the presence of an oil-based emulsion; and the 15 present invention avoids the use of oil. 16 This type of 17 synergy (where the immune response exceeds the sum of the immune responses of the individual components) is 18 19 also observed by using dextran sulphate (a polyanionic 20 adjuvant) in conjunction with saponin, Vanselow et al 21 (Vet. Rec. 117 37-43 (1985)). WO 88/07547 teaches that 22 the combination of DEAE-dextran and saponin in solution 23 is useful at eliciting antibody when mixed with antigen; however it is known that such combinations, or 24 the use of these adjuvants singly in solution, results 25 in a short-lived immune response of little or no 26 27 practical veterinary value. In contrast, the 28 formulation of these adjuvants into a solid implant 29 vaccine by the particular methods described here 30 provides the basis for veterinary vaccines with 31 longevity.

32

7

In a vaccine in accordance with the present invention, 1 the antigenic substance may give rise to antibodies 2 against a disease-causing agent, or against an agent 3 (such as a hormone) which does not normally give rise 4 to a disease. The disease causing agent may be a 5 structural component or toxin of a virus, bacterium or 6 Examples of virally-caused diseases 7 other microbe. which may be controlled by means of the present 8 invention include foot and mouth disease (FMD), 9 infectious bursal disease (IBD), Newcastle disease, 10 rabies, egg drop syndrome virus (EDS76) disease in 11 poultry, calcivirus, rhinotracheitis in cattle, bovine 12 ephemeral fever (BEF) and respiratory virus, among 13 14 others. Examples of bacterially-caused diseases include 15 botulism, clostridial infections, foot rot (for a 16 vaccine against which the antigenic substance may 17 comprise Bacterioides nodusus recombinant pili), 18 Caseous Lymphadenitis CLA in sheep caused by 19 Corynebacterium pseudotuberculosis toxin, among others. 20 Other microbial, such as fungal or protozoal, 21 infections may also be controlled by means of the 22 23 present invention.

24 25

26

27

28

29

30

31

Of the vaccines in accordance with this invention which caused the generation of antibodies against non-disease-causing agents, a vaccine against GnRH is one of the most preferred. Vaccines against other peptide hormones (for example growth hormone) are also commercially significant as are vaccines against certain non-peptide hormones, for example steroid hormones.

8

The antigenic substance may consist of the entity 1 2 against which antibodies are to be raised. frequently be the case when the antigenic substance is 3 characteristic of a disease-causing agent. However, in 4 5 some cases (particularly but not exclusively those 6 cases where it is desired to raise antibodies against non-disease-causing agents), the antigenic substance 7 may comprise a target antigenic moiety conjugated to a 8 9 carrier. The carrier will generally be selected so as not to be recognised as "self" by the animal to which 10 the vaccine is to be administered. Suitable carriers 11 include albumins including ovalbumin (not for poultry), 12 13 bovine serum albumin (not for cattle), human serum albumin (not for humans) and other albumins. 14 Alternatively, the carrier may be a different protein 15 16 or other molecule. Examples of proteinaceous carriers other than albumin include keyhole limpet haemocyanin 17 18 and beta-galactosidase, among others. It is not 19 necessary for the carrier either to be a protein or 20 even proteinaceous, but such carriers are preferred. 21 Carriers may in general be available from Sigma, Pierce 22 or Bio Rad, or any other convenient supplier.

23 24

25

26

27

28

29

30

31

The nature of the implant vaccine described here also lends itself to the use of several antigens either linked to the same or different carriers. Similarly, in cases where immunological problems such as antigen competition occur or when one antigen preparation inacivates another via mixing, the implant vaccine may be formulated so that different antigens are presented in distinct implants keeping individual antigens separate.

9

The target antigenic moiety may be conjugated to the 1 carrier, when a carrier is used, by any convenient 2 Suitable conjugators include glutaraldehyde, 3 toluene diisocyanate, carbodiimide, or any other suitable conjugator, which may effect a linkage through 5 a carboxyamino group. Such groups may be created by 6 means of activated diacid, such as an acid dichloride 7 Disuccinimidyl compounds are or an acid anhydride. 8 especially disuccinimidyl particularly suitable, 9 tartrate and disuccinimidyl suberate, both of which are 10 available from Pierce, as are many of the other 11 conjugators that are preferred for use in this 12 Other acceptable conjugators effect a invention. 13 linkage through thiol groups as disulphides or 14 thioethers; suitable conjugators include SPDP and other 15 aminodisulphydril cross-linkers and double agents such 16 as MBS. 17

18

The amount of antigenic substance present in each 19 vaccine dose will of course depend on the identity of 20 the antigenic substance and whether it is conjugated 21 Typically, for a conjugate vaccine it with a carrier. 22 may be expected that the amount of material 23 administered per injection should be from 10µg to 10mg. 24 For example in a GnRH vaccine, 2mg of conjugates may be 25 present of which 100 to 800µg would be GnRH (typically 26 200µg of GnRH) and 1.9 to 1.2mg would be carrier. 27 These amounts are purely illustrative and indicate 28 suitable levels for GnRH vaccines. 29

30

The saponin may be obtained from any convenient source.

Saponin is available from Sigma Chemical Co, USA, and a
particularly purified and lyophilised form is available

10

from Superfos Biosector A/S, Denmark, under the trade 1 2 It should be noted that it is not a mark QUIL-A. prerequsite that a single species be used; mixtures of 3 different saponins are quite acceptable.Preferred 4 5 saponins include those disclosed in WO-A-8809336. 6 7 The amount of saponin present can be any appropriate Amounts of from $50\mu g$ to 50mg may be suitable, 8 amount. for example, from $500\mu g$ to 5mg; an amount of about 1mg9 10 may be found to be particularly appropriate. 11 The polycationic adjuvant may be any suitable such 12 adjuvant, particularly including those disclosed in 13 WO-A-8801177. Diethylaminoethyl dextran (DEAE-dextran) 14 is particularly useful and may be supplied as the free 15 base or the hydrochloride or any other appropriate acid 16 addition salt. Other suitable polycationic adjuvants 17 include polylysine, polyethyleneimine and chitosan, 18 which again may be supplied either as the free base or 19 20 as an acid addition salt. The polycationic adjuvant may be buffered to be at or near physiological pH, as 21 will subsequently be described. 22 23 It should be noted that the invention contemplates the 24 use of a conjugate of the antigenic substance and 25 polycationic adjuvant as well as mere mixtures of two 26 separate components. 27 The antigenic moiety and polycationic moiety may therefore be covalently 28 attached, either directly or by means of a linking 29 30 element. 31 A vaccine in accordance with the invention can 32 optionally contain certain other components.

In

particular, the vaccine may contain a filler. The most preferred filler is calcium phosphate, particularly dibasic calcium phosphate dihydrate. A particularly suitable form of dibasic calcium phosphate dihydrate is sold under the trade mark EMCOMPRESS by Edward Mendell Co. Inc., Carmel, New York, USA. This preparation conforms to USP XX/FCC III. The average particle size of the calcium phosphate (or any other filler) may range from 20 to $200\mu\text{m}$, with 50 to $150\mu\text{m}$ being a typical range. Average particle sizes of about 100 µm are common. Alternative fillers may also be in the form of biodegradable polymers (see later).

The amount of calcium phosphate or equivalent filler may be such as to adjust the volume of the vaccine composition to a convenient amount. For example, a convenient maximum volume might be 1ml, but the circumstances will vary from case to case. The amount of calcium phosphate (or total filler) per unit dose vaccine formulation may range from 10mg to 1g, with from 20mg to 200mg being typical. The filler may comprise from 5 to 95% w/w of the weight of the formulation, with from 30 to 80% w/w being typical.

A further filler, which may for example be used in conjunction with the preferred calcium phosphate described above, is lactose. A suitable source of anhydrous lactose is direct compression lactose, such as that sold under the trade mark DCLactose 21 by De Melkindustrie Veghel BV of Veghel, The Netherlands. This formulation of anhydrous lactose satisfies the requirements of USP XXI/NF XVI. The amount of lactose

12

1 present can vary from 0 to 15% w/w, for example from 5 to 10% w/w, based on the total weight of the vaccine formulation. 4 5 Another filler which may be used is cholesterol. suitable source is the USP grade from Croda Inc, USA. 6 7 The amount of cholesterol present may vary from 0 to 80% w/w, for example from 25 to 50% w/w, based on the 8 total weight of the vaccine formulation. 9 10 11 Other (generally dry) fillers may be present, for sodium calcium hypophosphate or dry (for 12*p+91Xexample, 13 example freeze dried) aluminium hydroxide may be used as a filler. 14 15 16 Because preferred formulations of vaccines in accordance with the invention include tablets and 17 18 extrusions, the presence of a lubricant to aid in 19 formulation is desirable. Any suitable lubricant, such 20 as magnesium stearate, can be used, but it is generally preferred for the lubricant to comprise a hydrogenated 21 22 vegetable oil, such as that sold under the trade mark 23 LUBRITAB by Edward Mendell Co, Inc, Carmel, New York. 24 USA. 25 The lubricant may be present in an amount up to 5% w/w, 26 27 based on the total weight of the vaccine formulation, but is generally present in a range of from 0.5 to 2.5% 28 29 w/w. 30 31 Other adjuvants or components which stimulate the immune response may be present in vaccine formulations 32

in accordance with the invention, if desired.

example, muramyl dipeptide may be present. Lipid-based

2 products may also be present for this purpose.

3

A buffer may be present, for example to counteract the effect that the polycationic adjuvant has on the pH when the vaccine is administered.

7

8 Other acceptable excipients can be present in the 9 vaccine formulation in suitable amounts. It is 10 however, not necessary for any other ingredients to be 11 present.

12

The vaccines in accordance with the invention are solid and may therefore be in the form of a powder or granules, either of which may optionally be encapsulated, or compressed or otherwise prepared to form a tablet, bolus or extruded strip which may be cut or otherwise post-formed to any convenient length and/or shape.

20

In view of the generally solid nature of vaccines in accordance with the invention, they will generally be dry. This is not to mean that the vaccine as a whole, or any of the ingredients, is necessarily anhydrous.

25

Vaccines in accordance with the invention may be 26 implantable and/or injectable, and will therefore for 27 preference be sterile. A subcutaneously implantable 28 vaccine is preferred, but an intramuscularly 29 implantable vaccine is also viable. Intraperitoneally 30 implantable vaccines are less preferred but may be 31 suitable in some circumstances. It will not generally 32 be appropriate to implant or inject vaccines in 33

14

accordance with the invention intravenously, as saponins have a powerful lytic effect on red blood cells.

4

5 Although there may be some applications in which the present invention is suitable for treating humans, 6 7 species of animals which can usefully be treated by 8 means of the present invention include cattle, pigs, 9 sheep, deer, camels, horses, dogs and cats, to give but 10 a few examples. In each of these and other species the 11 vaccines of the invention can be used for conventional 12 purposes for the treatment of disease. In addition, in 13 each of these and other species, vaccines in accordance with the invention can be used for purposes other than 14 preventing disease, for example for modulating hormone 15 16 activity, particularly fertility hormone activity. 17 cattle, vaccines in accordance with the invention may 18 be used bio-chemically to immunologically neuter bulls 19 and cows. Immunoneutering of sheep and pigs is also a particularly preferred application. 20 Immunocastration of ram lambs destined for the prime lamb market is a 21 22 specific example.

23

24 It is by no means necessary for vaccines in accordance 25 with the invention to be restricted to having a single 26 function. Disease-preventing vaccines may be 27 multifunctional, as may hormone activity-modulating 28 vaccines. Additionally, vaccines in accordance with 29 the invention can combine very different activities, 30 such as disease prevention and hormone activity 31 regulation.

32

15

Vaccines in accordance with the invention can be 1 prepared by any convenient method, all of which are 2 within the scope of the invention. It may be 3 appropriate under some circumstances to prepare 4 vaccines merely by adequately admixing the ingredients. 5 According to a second aspect of the invention, 6 therefore, there is provided a process for the 7 preparation of a vaccine, the process comprising 8 admixing (a) an antigenic substance capable of inducing 9 the generation of antibodies on parenteral 10 administration to an animal, (b) a saponin and (c) a 11 polycationic adjuvant. 12

13

A particularly preferred way to prepare a vaccine in 14 accordance with the first aspect of the invention 15 involves freeze drying the components from a (for 16 example aqueous) solution. For some reason that is not 17 entirely clear, but may be to do with the degree of 18 intimate admixture obtainable by such a process, 19 vaccines prepared in this method have been found to be 20 very satisfactory. 21

22

According to a third aspect of the present invention, 23 therefore, there is provided a process for the 24 preparation of a vaccine, the process comprising 25 lyophilising a solution (for example an aqueous 26 solution) of (a) an antigenic substance capable of 27 inducing the generation of antibodies on parenteral 28 administration to an animal, (b) a saponin and (c) a 29 polycationic adjuvant. 30

31

32

16

The solution is preferably stirred thoroughly (for 1 2 example, for at least 2 hours or even 24 hours or more) 3 prior to lyophilisation for optimum results. 4 5 The solution will generally be aqueous and may include 6 a buffer to bring the pH of the solution near to neutrality and/or physiological pH. 7 8 9 In certain cases (for example to prolong the release of active vaccine constituent) it may be preferred to 10 admix the antigenic substance and the two adjuvants 11 12 with the fillers by wet granulation and lyophilise the 13 common mixture. 14 15 Although under some circumstances, as discussed above, 16 the antigenic substance and the two adjuvants (the 17 saponin and the polycationic adjuvant) can be lyophilised from a common solution, it may under some 18 circumstances be possible to prepare satisfactorily an 19 20 immunoadjuvant composition, to which the antigenic substance can subsequently be added. 21 22 23 According to a fourth aspect of the present invention, 24 therefore, there is provided an immunoadjuvant comprising a saponin and a polycationic adjuvant. 25 26 27 As discussed above, vaccines in accordance with the invention are preferably solid. 28 The vaccine may for preference be in tablet form or be formed by extrusion 29 to a desired length. A vaccine including its active 30 components in accordance with the invention may be 31 32 The coat may be water impermeable but erodible, so that after a suitable period of time the 33

17

coat will dissolve or otherwise break down to enable 1 release of the active components of the vaccine. 2 possible in this way to provide a plurality of 3 implants, ranging from being non-coated to each having 4 a coat of particular thickness and/or erodibility 5 characteristics such that, for example, one implant 6 might release active components immediately to provide 7 a primary sensitising dose while others may release 8 weeks or even months later to provide boosting doses 9 and thereby extend the longevity of the immune 10 11 response.

12

A variety of materials can be used for the coat, 13 whether as an erodible or biodegradable coat. 14 Polyesters constitute a preferred category 15 erodible/biodegradable encapsulating polymers that are 16 also biocompatible; examples include polylactide, 17 polyglycolide and poly(lactide-co-glycolide) such as 18 those sold under the trade mark MEDISORB by the Dupont 19 Company, USA., poly(hydroxybutyric acid) such as that 20 sold by Chemie Holding, Linz, 21 poly(hydroxybutyric acid-co-valeric acid) such as that 22 sold by Aldrich Chemicals, USA, or ICI, UK. Other 23 suitable erodible biodegradable polymers include 24 polyacetals, polyorthoesters and polyorthocarbonates 25 as is disclosed in EP-A-0052510 (Syntex). It will be 26 appreciated that coatings can conveniently be made from 27 a mixture of the above or other polymers, particularly 28 when ester derivatives are used. 29

30

The coat may alternatively remain essentially intact after implantation; it may be semi-permeable to ensure adequate leaching out of ingredient. The coat may be

18

1 non-biodegradable if desired. Cellulose derivatives 2 constitute a suitable category of polymer; 3 include ethyl cellulose, such as that sold under the 4 trade mark ETHOCELL by Dow Chemical Co, USA, methyl 5 cellulose, such as that sold under the trade mark METHOCELL by Dow Chemical Co. 6 7 hydroxypropylmethyl cellulose, such as that sold under 8 the trade mark PHARMACOAT by Shinetsu Chemical Co of 9 Methacrylate derivatives form another suitable Examples include a 1:2 poly (methacrylic acid, 10 11 methylmethacrylate) polymer sold under the trade mark 12 EUDRAGIT S100 by Rohm Pharma, West Germany and 1:2:1 13 poly (butylmethacrylate, methacrylate, 14 methylmethacrylate) polymer sold under the trade mark 15 EUDRAGIT E100 also by Rohm Pharma.

16

It should be noted that the invention in certain 17 18 circumstances (for example to allow enable pulsed 19 antigen/adjuvant release at delayed time intervals) 20 contemplates coating granules of the active 21 antigen/adjuvant mix itself by solvent evaporation onto 22 granules, wet granulation or fluidised bed spray 23 coating or other means, with a mixture of the above or 24 other erodible or biodegradable polymers prior to 25 formulating into a vaccine as granulates or as compressed tablets. Such polymer coated granules are 26 27 particularly useful as vaccine implants when used in conjunction with cholesterol as a filler. 28

29

According to a fifth aspect of the invention, there is 30 provided a method of treating a human or another 31 animal, the method comprising administering a vaccine 32 in accordance with the first aspect of the invention. 33

19

1 The invention therefore encompasses the use of (a) an 2 antigenic substance capable of inducing the generation 3 of antibodies on parenteral administration to an 4 animal, (b) a saponin and (c) a polycationic adjuvant 5 in the preparation of a vaccine. 6 7 As vaccines in accordance with the first aspect of the 8 invention can be used as one-shot vaccines, a single 9 shot constitutes the preferred treatment regimen. 10 However, the use of two- and multiple-shots is not 11 ruled out, if the circumstances (or preference) 12 require. If more than one administration is required, 13 the time between administrations is preferably such as 14 to give rise to an effective anamnestic response. 15 16 The invention will now be illustrated by the following 17 18 examples. 19 20 EXAMPLE 1 21 The following examples illustrate the preparation of an 22 antigenic peptide-protein conjugate in particular a 23 GnRH based product for fertility control. 24 25 26 A Preparation of Antigen (Peptide-Protein Conjugate) 27 28 1g of GnRH modified at its carboxyl terminus from -gly 29 amide to a -gly acid is added to 1g of ovalbumin in 30 water. This is followed by the addition of a 25-fold 31 molar excess over the peptide of 1-ethyl-3-(3-dimethyl 32 aminopropyl) carbodiimide hydrochloride, giving a 0.25M 33

20

The pH of the mixture is controlled at solution. 2 between 6.5 and 7 by titration with 1M hydrochloric 3 acid for at least 5 hours, followed by dialysis against 4 water and then reaction in 0.5M hydroxylamine at pH 7 5 for 5 hours. The final reaction mix is dialysed 6 against water, filtered through a 0.2 micron membrane 7 and freeze dried. Progress of the reaction to form 8 peptide-protein conjugate, and dialysis to remove 9 unconjugated low molecular weight by-products is 10 monitored by analytical HPLC. The peptide content of 11 the conjugate is determined by differential amino acid 12 analysis relative to the amino acid content of carrier protein alone. (The treatment with hydroxylamine helps 13 14 obtain a water-soluble product with consistent peptide 15 content.)

30g of DEAE-dextran (eg from Pharmacia, Sweden, or Sigma Chemical Co, USA) is mixed with 4.2g of saponin (eg from Sigma Chemical Co, USA or as a lyophilised preparation such as that sold under the trade mark QUIL-A from Superfos Biosector A/S, Denmark) and 2g of solid tris-(hydroxymethyl)aminomethane (eg Trizma Base Sigma Chemical Co, USA). The mixture is dissolved in distilled water (1.75 litres) and adjusted to pH 7 ± 0.2 units with a 2M aqueous solution of Trizma (pH 10.5).

18 19 20 21 22 23 24 25 26 27 28 29	DC-Lactose LUBRITAB Hydrogenated vegetable oil Antigen/Adjuvant mix from Example 1	72.5g 8.0g 2.5g 17.0g T: 100.0g	(average) 170 19 6 40 —— 235mg

15 minutes. The antigen/adjuvant mix from Example 1 is

22

then added, and the mixture is blended together for a 2 further 15 minutes in an ERWEKA AR400 (trade mark) cube mixer from Erweka Apparatebau GmbH, Heusenstama, West 4 Germany. The resulting mixture was sieved through a 5 350 mm mesh, and the hydrogenated vegetable oil was added to the sieved mixture and then blended for 15 6 7 minutes, again in the ERWEKA AR400 cube mixer. 8 9 The blended mixture of ingredients is compressed into tablets in a 4.5mm punch and dye, using the MANESTY SP1 10 11 (trade mark) single punch tabletting machine from 12 Manesty Machines Ltd, Liverpool, UK. The resulting tablets weighed 235mg \pm 23mg, had a diameter of 4.5mm 13 14 and a length of 8.6 \pm 0.6mm. 15 16 EXAMPLE 3 17 The procedure of Example 1 was followed, except that 18 19 the proportions of the adjuvants, buffer and antigenic 20 conjugate were as follows: 21 Conjugate (GnRH-ovalbumin) 200mg 22 23 DEAE-dextran 6.0g 24 Trizma 400mg 25 Saponin 840mg 26 27 The DEAE-dextran, Trizma and Saponin were made up in 350ml distilled water and adjusted to pH 7 with 2M 28 29 A conjugate was then added to this solution, which was thoroughly mixed for 24 hours and then freeze 30 31 The resulting antigen/adjuvant mix was sieved $(350\mu\text{m}\text{ mesh})$, then mixed with the other components in 32 33 the amounts given below to form implants:

1	
2	EMCOMPRESS Calcium Phosphate 30.31g
3	DC-Lactose 3.37g
4	LUBRITAB hydrogenated
5	vegetable oil 1.04g
6	Antigen/Adjuvant Mix 6.88g
7	
8	TOTAL WEIGHT: 41.6g
9	
10	This mixture yielded up to 175 implants weighing
11	approximately 235mg each. Each implant contained
12	approximately 1.1mg of conjugate, equivalent to about
13	125µg GnRH.
14	
15	EXAMPLE 4
16	
17	The tablets produced in Example 3 were used to
18	immunologically castrate rams (Dorset/Merino) as
19	follows.
20	mi de la compania del compania del compania de la compania del la compania de la
21	The rams were divided into six groups, each of five animals, and dosed with 1, 2 or 3 tablets in one or two
22	implantations by subcutaneous implantation by means of
23 24	a trocar in the neck region below the ear.
25	a tiotal in the neon region below the car.
26	Testicular weight at various time intervals from the
27	first implantation was measured by orchidometry, a
28	comparative palpation procedure using a graded set of
29	beads for reference. [C.M. Oldham et al Aust. J. Agric.
30	Res. 29, 173-179 (1978)]. The second implantation was
31	4 weeks after the primary implant. The results eight
32	weeks after the first implantation are shown in Figure
33	1 and demonstrate the ability of the implant

24

3

1 formulation to effect testicular atrophy in mature 2 rams.

3

Example 5

4 5

The implant vaccines were used to examine the effect of 6 changes in immuno-adjuvant formulation on testicular 7 development in growing ram lambs. Groups of 5 second 8 cross ram lambs 5 to 7 weeks of age were immunised 9 subcutaneously in the neck below the ear with various 10 GnRH vaccine implants having varying amounts and 11 The implants were made as 12 treatments of adjuvants. 13 described in Example 3 except that the amounts of DEAE-dextran and/or Saponin were reduced. The amounts 14 15 of Emcompress calcium phosphate were increased accordingly to maintain implant weights 16 approximately 235mg. The adjuvants, buffer and antigen 17 conjugates were mixed in aqueous solution for 24 hours 18 19 prior to freeze drying and incorporation into implants. One implant was given at primary (10) and one at the 20 secondary (20) boost 5 weeks later. The results shown 21 in Table 1 illustrate the effect of varying adjuvant 22 23 formulation on testicular development in prepubertal 24 ram lambs. Also shown is a dry mixed antigen/adjuvant formulation and a reference oil adjuvant vaccine 25 26 [Hoskinson et al. Aust. J. BIOTECH 4, 166-170 (1990)] at 1mg antigen/2ml dose. 27

26

DRY MIX denotes antigen/adjuvant formulation dry mixed 1

- only before implant production.
- 3 DO.5, DO.25: DEAE-dextran at one half and one quarter
- 4 respectively the amount in Example 3.
- 5 Q is Quil A Saponin at half the amount of Sigma Saponin
- in Example 3 and each implant has 2 mg antigenic 6
- 7 conjugate instead of 1.1 mg.
- VAX is the reference oil adjuvanted vaccine. 8
- 9 CONTROLS are placebo implants which contain
- 10 carbodiimide treated ovalbumin instead of
- 11 GnRH-ovalbumin conjugate.
- 12 N.T. denotes not tested.

13

- 14 Ram lambs are considered sexually competent when
- 15 testicular weight exceeds 120 grams (WO-A-8801177).
- 16 Table 1 shows that DEAE-dextran and Saponin alone or in
- 17 combination retard testicular development in lambs when
- 18 given as adjuvants in GnRH implant vaccines.
- 19 Combinations of the two adjuvants have a more profound
- Admixing the adjuvants and antigens in aqueous 20
- solution and lyophilising the mixture results in a more 21
- 22 effective implant than simple dry admixing (compare
- 23 groups 1 and 2). The results demonstrate the viability
- of solid implant vaccines in immunologically delaying 24
- 25
- puberty (compare groups 1 and 8 with 10).
- 26 formulation used gives comparable results to a
- commercial oil-based liquid vaccine (compare groups 1 27
- and 8 with 9). 28

29

- The effect of implant GnRH vaccines (single 31
- administration) on testicular status in growing ram 32

27

lambs or mature rams were examined (Table 2 and Figure 1 2 2). 3 Groups of second cross ram lambs (3 to 5 weeks of age) 4 and mature rams (12 months) were immunised 5 subcutaneously by trocar in the neck region below the 6 ear with GnRH vaccine implants: The implants were 7 prepared as indicated for Group 8 in Example 5 (Table 8 1) in which Quil A saponin was used and each implant 9 (235mg size) contained 2 mg of GnRH conjugate. 10 implants were used uncoated or were coated (10 µm thick) 11 with an under layer of hydroxypropylmethylcellulose 12 ("Pharmacoat" HPMC 615; Shinetsu Chemical Co Ltd. Japan) 13 to prepare a suitable surface for the main coat (80 µm 14 thick) of "Medisorb" 100DL lactide polymer (80-110k 15 Daltons) applied in acetone: isopropanol (70:30 W/W) 16 17 solvent. A protecting coat of HPMC 615 (10 µm thick) was finally applied. 18 19 The implants were pan coated using an Erweka AR 400 20 drive unit, a 9.5 litre (type DK) coating pan and an 21 Aeromatic (type Strea-1) spraying device with ER 39 22 nozzle (1.1 mm orifice). 23 24 25 26 27 28 29 30 31 32

31
    coated as described in the text.
32
    VAX is the reference oil adjuvant vaccine.
```

29

1 Controls are placebo implants as described in Table 2.

2

4

5

6

7

8

The results demonstrate that a single implantation in either immature or mature rams will suppress or regress testicular development. Whilst a secondary boost enhances the effect, a coated implant given at the same time as the first implantation allows for implants with a delayed release (compare Groups A 3 and A 4).

9 10

In another group of ram lambs an uncoated implant 11 prepared according to Example 3 was given to each lamb 12 in conjunction with an implant that contained 13 cholesterol filler in various amounts in place of 14 The results are shown in Figure 2 calcium phosphate. 15 and demonstrate that the use of cholesterol as an 16 additional filler (between 20% and 80% of implant 17 weight) can be used to advantage in constructing solid 18 vaccines suitable for single implantations. 19

20 21

EXAMPLE 7

22

In order to demonstrate the solid implant vaccine 23 approach for disease applications in animals we 24 undertook experiments to test serological responses to 25 a number of relevant antigens. In each case the 26 antigens were produced by Arthur Webster Pty. Ltd. (an 27 Australian veterinary vaccine manufacturer) of Sydney, 28 The example shown is a solid implant Australia. 29 vaccine for ovine footrot and is preared from 30 concentrated purified <u>Bacteroides nodosus</u> pilus 31 antigens derived from recombinant Pseudomanas 32 aeruginosa representing the nine B. nodosus serogroups 33

30

9

1 A to I. All antigens were mixed together before 2 blending into vaccine. The aqueous solution of antigen representing 100 doses was freeze dried. 3 4 mixture was then formulated with the following 5 components in a manner similar to that described for Example 3. 6 7 8 DEAE-dextran 3.4g Trizma 230mg

9 10 Saponin 480mg 11 Dried Antigen mix 100 doses 12 Water 200ml

13 14

15

16

17

The mixture was carefully stirred to dissolve the components and the pH was adjusted to 7.0 with 2M The solution was stirred for 24 hours at 20°C prior to freeze drying. The dried antigen/adjuvant mix was sieved through a 350 µm stainless steel mesh.

18 19 20

21

22

Formulations were made to contain the equivalent of either one dose (A) or about half dose (B) of antigen per implant as follows:

23		A	В
24	EMCOMPRESS Calcium Phosphate	8.7g	9.6g
25	DC-Lactose	0.97g	1.07g
26	Lubritab	0.3g	0.3g
27	Antigen/Adjuvant	2.0g	1.09

28 29

30

31 32

33

Implants were made as described in Examples 2 and 3 and administered via trocar. A single implant was used at each vaccination except where designated as "A+B" in Table 3 below - in these cases the animals vaccinated both with one A and with one B tablet at the

31

1 same time at the same site. An oil adjuvanted liquid 2 vaccine in 1ml volume served as a reference standard -3 this was prepared from the same antigen mix at the dose 4 level of the A implants. 5 6 Groups of 8 sheep were immunised with a 4 week 7 interdose interval. To illustrate the immune response, 8 individual sera were tested for response to each of 5 9 serogroups (A,B,C,D, and I); results presented below (Table 3) are grand geometric means (GGM) i.e. the mean 10 11 of the geometric means for the 5 serogroups. The sera 12 from the sheep were tested at various intervals during 13 the trial using a normal microtitre plate agglutination 14 assay. 15 16 17 Table 3 18 19 Antibody titrations for footrot vaccines 20 21 GMM at various time intervals 22 23 0(10) 4(2⁰) 7 24 VACCINE GROUP WEEK 25 26 27 $A(1^{\circ})/A(2^{\circ})$ 4020 NT 760 1440 $A(1^{\circ})/B(2^{\circ})$ 28 NT 830 4160 1350 $(A + B) 1^{O}$ only 29 NT 760 790 NT Standard 10, 20 30 NT 250 1330 770 Controls 31 60 70 70 NT32

ŗ

1	<u>CLAIMS</u>

2

3 1. A solid vaccine composition comprising an

4 antigenic substance capable of inducing the generation

5 of antibodies on parenteral administration to an

6 animal, a saponin and a polycationic adjuvant.

7

8 2. A vaccine according to Claim 1 wherein the

9 antigenic substance gives rise to antibodies against a

10 disease causing agent.

11

12 3. A vaccine according to Claim 2 wherein the

13 disease causing agent comprises bacteria, virus, fungus

14 or protozoa.

15

16 4. A vaccine according to Claim 3 wherein the

17 disease causing agent comprises the bacteria causing

18 foot rot, botulism or caseous lymphadenitis (CLA) or

19 the viruses causing bovine ephemeral fever (BEF) or

20 foot and mouth disease.

21

22 5. A vaccine according to Claim 1 wherein the

23 antigenic substance gives rise to antibodies against an

24 agent which does not normally cause disease.

25

26 6. A vaccine according to Claim 5 wherein the agent

27 is a peptide or a non-peptide hormone.

28

29 7. A vaccine according to Claim 6 wherein the agent

30 is gonadotrophin releasing hormone (GnRH).

31

32 8. A vaccine according to Claim 6 wherein the agent

33 is growth hormone.

35

1

3 9. A vaccine according to claim 1 wherein the

4 antigenic substance comprises the entity against which

5 antibodies are to be raised.

6

ς

7 10. A vaccine according to claim 1 wherein the

8 antigenic substance comprises a target antigenic moiety

9 conjugated to an immunogenic carrier.

10

11 11. A vaccine according to Claim 10 wherein the

12 carrier is a proteinaceous material.

13

14 12. A vaccine according to claim 1, additionally

15 including a filler.

16

17 13. A vaccine according to Claim 12 wherein the filler

18 comprises calcium phosphate.

19

20 14. A vaccine according to Claim 12 wherein the filler

21 comprises cholesterol.

22

23 15. A vaccine according to claim 1 which is formulated

24 as a powder, granules, tablets, boluses or extruded

25 strips.

26

27 16. A vaccine according to claim 15 which is adapted

28 to be implanted into a patient.

29

30 17. A vaccine according to claim 1 for fertility

31 control and immunoneutering of animals.

32

36

A vaccine composition according to claim 15 which 1 is coated with a polymer which is water impermeable but 2 erodible or is semi-permeable. 3 4 A vaccine composition according to claim 18 5 containing a plurality of implants, the implants having 6 coats of various thicknesses and/or erodibility 7 8 characteristics such that periodic delivery of the antigen/adjuvant doses can be achieved. 9 10 20. An immunoadjuvant comprising a saponin and a 11 12 polycationic adjuvant. 13 14 A vaccine according to claim 1 or immunoadjuvant according to claim 20 wherein the 15 16 polycationic adjuvant comprises diethylaminoethyl dextran (DEAE-dextran) or a salt thereof. 17 18 The preparation of a vaccine according to claim 1 19 20 by the admixing of: 21 22 (a) an antigenic substance; (b) a saponin; and 23 - 24 (c) a polycationic adjuvant. 25 The preparation of a vaccine according to claim 22 26 comprising lyophilising a solution of: 27 28 (a) an antigenic substance; 29 (b) a saponin; and 30 (c) a polycationic adjuvant. 31 32

37

24. The preparation of a vaccine according to claim 23 wherein the solution is an aqueous solution.
3
25. The preparation of a vaccine according to claim 22

wherein an antigenic substance, a saponin and a polycationic adjuvant are admixed by wet granulation optionally in the presence of a filler, and the common

8 mixture is lyophilised.

9

Ţ

10 26. The preparation of a vaccine according to claim 1
11 comprising coating granules of the active
12 antigen/adjuvant mix by solvent evaporation on to the
13 granules, wet granulation, or fluidised spray coating
14 or other means, with a polymer or a soluble mixture of
15 polymers, followed by the formulation into a vaccine as
16 a granulate or compressed tablets.

17

18 27. A method of treating an animal by means of administering a vaccine according to claim 1.

20

21 28. The use of an antigenic substance capable of 22 inducing the generation of antibodies on parenteral 23 administration to an animal, a saponin and a 24 polycationic adjuvant in the preparation of a solid 25 vaccine composition.

FIG.2
Effects of cholesterol filler in GnRH Implant Vaccines on Testicular Status in Growing Ram Lambs

- 1. Reference of 1 adjuvant Vaccine 1° followed by 2° 4 weeks later
- 2. D1:S1 implant vaccine 1° followed by 2° 4 weeks later
- 3. D1: S1 Plus D1: S1 with 50% cholesterol filler; 1° only
- 4. D1: S1 Plus D1: S1 with 80% cholesterol filler; 1° only
- 5. D1: S1 Plus D1: S1 with 20% cholesterol filler; 1° only
- 6. D1:S1 Plus D1:S1 with 10% cholesterol filler; 1° only
- 7. D1:S1 Plus D1:S1 with no cholesterol; 1° only
- 8. Controls (1° only); Mean Testicular weight at week 8 is 135g

URTHER INFORMATION CONTINUED FROM THE SECOND SHEET
OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE 1
This international search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons: Claim numbers 27 because they relate to subject metter not required to be searched by this Authority, namely: Pls. see Rule 39.1(iv) - PCT: Method for treatment of the human or animal body by surgery or therapy, as well as diagnostic methods.
Claim numbers, because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically: Claim numbers, because they are dependent claims and are not drafted in accordance with the second and third sentences of
PCT Ruie 6.4(a).
/I. OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING 2
As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims of the international application.
No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims: it is covered by claim numbers:
As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee. Remark on Protest
The additional search fees were accompanied by applicant's protest. No protest accompanied the payment of additional search fees.

ANNEX TO THE INTERNATIONAL SEARCH REPORT ON INTERNATIONAL PATENT APPLICATION NO.

GB 9001459

SA 40378

This annex lists the patent family members relating to the patent documents cited in the above-mentioned international search report. The members are as contained in the European Patent Office EDP file on 07/12/90

The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
